

ENTERPRISE AI KNOWLEDGE ASSISTANT

Enterprise Project Management Toolkit

Business Requirements Document

BRD – Enterprise AI Knowledge Assistant

Document Title	Business Requirements Document (BRD)
Project Name	Enterprise AI Knowledge Assistant (EAIKA)
Document Owner	Mautik Patel, AI Project Delivery Manager
Version	1.0
Status	Approved
Date	July 4, 2026

1. Introduction

This Business Requirements Document (BRD) captures the business needs and objectives that the Enterprise AI Knowledge Assistant (EAIKA) must satisfy. It describes the current-state problem, desired future state, business requirements, and success criteria from the perspective of the organization and its end users. Detailed system behavior is defined separately in the Functional Requirements Document (FRD) and Product Requirements Document (PRD).

2. Business Background

Organizations generate large volumes of documentation across project management, human resources, finance, compliance, and operations. As this volume grows, employees spend increasing amounts of time manually searching folders, emails, and file repositories to locate answers that already exist somewhere within the organization's knowledge base. This is compounded by inconsistent terminology across departments, reliance on individual subject matter experts, and the risk of acting on outdated or conflicting versions of information.

3. Business Objectives

Objective	Description	Business Metric
Reduce time-to-answer	Enable employees to get accurate answers to enterprise knowledge questions without manually opening multiple documents.	Reduction in average time spent searching for information per employee per week.
Preserve institutional knowledge	Consolidate documents into a searchable knowledge base independent of individual expert availability.	Percentage of common questions answerable without escalation to an SME.
Protect data confidentiality	Ensure sensitive enterprise data never leaves the organization’s-controlled environment.	Zero instances of document content transmitted to external/cloud AI services.
Improve decision quality	Provide source-cited answers so users can verify information before acting.	Adoption rate and user-reported trust score in pilot survey.
Accelerate onboarding	Give new employees a single place to ask questions instead of searching multiple systems.	Reduction in time-to-productivity for new hires in pilot department.

4. Business Problem Statement

Project and program management teams currently maintain critical knowledge, including **project charters, business requirement documents, functional specifications, RAID logs, status reports, steering committee decks, UAT signoffs, and deployment records**, in disconnected files across shared drives and email. When a stakeholder asks a question such as **"What is our current project health?"** or **"What are the highest project risks?"**, answering requires manually reviewing multiple documents, often across several projects, with no guarantee of finding the most current version.

5. Target Users / Business Stakeholders

User Group	Business Need
PMO & Project Managers	Instant answers on project health, milestones, risks, and status without manual document review.
Executive Sponsors	Quick, trustworthy summaries of program status for decision-making, without waiting for a report to be compiled.
Delivery / Engineering Teams	Fast access to technical decisions, deployment steps, and issue resolution history.

Business Stakeholders	Ability to verify who approved a requirement or when a decision was made, with a source reference.
Knowledge Base Administrators	Ability to upload documents, rebuild the knowledge index, and monitor knowledge base health.

6. Business Requirements

ID	Business Requirement	Priority
BR-01	The organization shall be able to ask natural-language questions about uploaded project management documents and receive an accurate answer.	Must Have
BR-02	Every AI-generated answer shall be traceable to the specific source document(s) it was derived from.	Must Have
BR-03	All document processing and AI inference shall occur within the organization's own environment, with no data sent to external cloud AI providers.	Must Have
BR-04	The platform shall support the common enterprise document formats already in use by the organization (PDF, Word, PowerPoint, Excel, text, CSV, email, images).	Must Have
BR-05	Authorized administrators shall be able to add new documents to the knowledge base without engineering support.	Must Have
BR-06	The platform shall be extensible to additional knowledge domains (HR, Finance, Compliance, Operations) beyond the initial pilot.	Should Have
BR-07	The organization shall be able to monitor knowledge base size, document inventory, and indexing status.	Should Have
BR-08	The platform shall reduce, measurably, the time employees spend searching for information compared to current manual methods.	Must Have

7. Success Criteria

- Pilot department (PMO / project delivery) actively using the assistant for day-to-day project questions within 30 days of go-live.
- A minimum of 80% of test questions during UAT answered accurately with correct source citation.
- No confidential document content transmitted outside the organization's-controlled environment, verified through security review.
- Positive user feedback (satisfaction score) collected during the post-implementation review.

8. Assumptions and Dependencies

- Business stakeholders will provide a representative set of project management documents for the pilot knowledge base.
- IT/Infrastructure will provision adequate on-premises or private compute resources ahead of the build phase.
- Information Security will review and approve the local-deployment data handling model prior to go-live.

9. Out of Scope

- Automated actions that modify source systems (e.g., closing a ticket, updating a project plan) are not part of this business requirement set; the platform is read-only / advisory in Phase 1.
- Legal and contractual document domains are considered future-phase expansion and are not part of the initial business requirements.

10. Approval

Name / Role	Approval	Date
David Okonjo – Head of Fraud Operations	Approved	Feb 3, 2026
Priya Nataraj – Head of Data Science	Approved	Feb 3, 2026
Sarah Whitfield – Chief Risk Officer	Approved	Feb 4, 2026
